                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel purified human soluble guanylate cyclase alphal/betal (hsGCalphal/betal). The products of the invention have antiarteriosclerotic, vasotropic and hypotensive activity. Nucleic acid sequences encoding the alphal and/or betal subunit are useful for somati gene therapy of arteriosclerosis and restenosis, ischemia (infarct), peripheral arterial occlusive disease and arterial hyportension. Antibodies to hsGCalphal/betal can be used for diagnosis of aberrant hsGCalphal/betal expression in human tissues. This sequence represents the human soluble guanylylcyclase betal subunit described in the method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        23-MAR-2000;

                                                                                                                                                                                                                              This invention describes novel purified human soluble guanylate cyclase alphal/betal (hsGCalphal/betal). The products of the invention have antiarteriosclerotic, vasotropic and hypotensive activity. Nucleic acid sequences encoding the alphal and/or betal subunit are useful for somati gene therapy of arteriosclerosis and restenosis, ischemia (infarct), peripheral arterial occlusive disease and arterial hypertension.

Antibodies to hsGCalphal/betal can be used for diagnosis of aberrant hsGCalphal/betal expression in human tissues. This sequence represents the human soluble guanylylcyclase alphal subunit described in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human: guanylylcyclase alphal; hsGCalphal; hsGCbetal; soluble; guanylylcyclase betal; antiarteriosclerotic; vasotropic; hypotensive; gene therapy; arteriosclerosis; restenosis; ischemia; diagnosis; peripheral arterial occlusive disease; arterial hypertension.

The method comprises contacting a biological sample from the patient with comprises contacting a biological sample from the patient with comprises contacting a biological sample from the patient with comprises contacting a biological sample from the patient with comprises to a sequence that is at least 80% identical to them. The prostate cancer associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in comprise to the prostate cancer and are derived from the tissues of various or organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating composite cancer in mammals. The prostate cancer, as well as for comparison modulators of prostate cancer, as well as for composite cancer. The nucleic acid sequences are particularly useful composition of the prostate cancer associated genes are composition of the prostate cancer associated prostations.

CC and another therapy, as a vaccine or in antisense applications.

concer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with comprises contacting a biological sample from the patient with comprises contacting a biological sample from the patient with comprises contacting only nucleotides (designated PC genes) that contact provides to a sequence that is at least 80% identical content of them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in contact cancer and are derived from the tissues of various content of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer associated genes are cuseful for diagnosing or treating prostate cancer, as well as for contentifying modulators of prostate cancer or agents that inhibit contentifying modulators of prostate cancer or agents that inhibit content concer. The nucleic acid sequences are particularly useful concertance. ABG61800-ABG61944 represent prostate cancer-associated proteins.

capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

(ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                  Drosophila melanogaster

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL11840-ABL16175) and the encoded proteins

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to dealgn expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

```
cc encoding the human natriuretic peptide receptor Ayguanylate cyclase A CC (atrionatriuretic peptide receptor A) guanylate cyclase A CC (atrionatriuretic peptide receptor A) or NPRI polypeptide. A method for CC haplotyping the NPRI gene in an individual comprises identifying the CC nuclectide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the NPRI haplotypes given in the specification or whether both copies are defined by a haplotype CC pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a CC trait and a haplotype or haplotype pair of the NPRI gene can be CC identified by comparing the frequency of the haplotype or haplotype pair in a reference population, where a higher haplotype CC frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. NPRI and its corresponding DNA are used for studying the expression and function of NPRI, for use in screening CC hypertension. The sequences are also useful for studying the effect of correspondences are also useful for studying the effect of correspondences are also useful for studying the effect of correspondences are also useful as on the binding caffinity of candidate drugs targeting NPRI. This sequence represents the cCC human NPRI polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

NPR1 variant

polypeptide

```
CC encoding the human natriuretic peptide receptor Ayguanylate cyclase A (atrionatriuretic peptide receptor Ayguanylate cyclase A (cc) (atrionatriuretic peptide receptor Ayguanylate cyclase A (cc) (atrionatriuretic peptide receptor A) or NPRI polypeptide. A method for Cc haplotyping the NPRI gene in an individual comprises identifying the Cc nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the NPRI haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype copairs can be assigned to specific genotypes. An association between a cc trait and a haplotype or haplotype pair of the NPRI gene can be cc identified by comparing the frequency of the haplotype or haplotype pair in a reference population, where a higher haplotype cr haplotype pair in a reference population, where a higher haplotype cr haplotype or haplotype pair. NPRI and its corresponding DNA are used cfor studying the expression and function of NPRI, for use in screening corrected or candidate drugs to treat diseases related to NPRI activity, such as higher thaplotype pair. The sequences are also useful for studying the effect of variation on the biological activity of NPRI as well as on the binding caffinity of candidate drugs targeting NPRI. This sequence represents a finity of candidate drugs targeting NPRI. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genotyping human natriuretic peptide receptor A/guanylate cyclase gene of an individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene -

Human proteins and DNA encoding sequences useful for preventing treating or ameliorating a medical condition in a mammalian subg. arthritis or and subject

Claim 20; Page 246-247; 1963pp; English

haematopolesis regulatory activity; tissue growth activity; chamic conditions; chamic conditions activities; chamic conditions activities; activities; inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound the heat in these with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Polypeptides with growth factor activity may be used to manipulate stem cells in culture to give rise to neuroepthelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may be used in cell cultures to give rise to neuroepthelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention. or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention me have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides Sequences ABB10981-ABB12330 represent 1350 novel polypeptides, an cell

These proteins are enterotoxin receptors which may be used as a therapeutic to contintestinal fluid permeation as well as abnormal conditions caused by bacterially released enterotoxin. The binding domain of the proteins, or antibodies to the proteins, can be used to eliminate diarrhoea. The proteins may be used to isolate ligands and to scree for antagonists of toxin binding.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

guanylate cyclase (EC 4.6.1.2), soluble, alpha-1 chain - rat
N;Alternate names: guanylate cyclase, soluble, 77K chain
C;Species: Rattus norvegicus (Norway rat)
C;Date: 31 Mar-1993 #sequence_revision 31-Mar-1993 #text_change 18-Jun-1999
C;Accession: A38297
R;Nakane, M.; Arai, K.; Saheki, S.; Kuno, T.; Buechler, W.; Murad, F.
J. Biol. Chem. 265, 16841-16845, 1990
A;Title: Molecular cloning and expression of cDNAs coding for soluble guanylate cyclase
A;Reference number: A38297; MUID:91009100; PMID:1698769
A;Accession: A38297
A;Molecule type: mRNA
A;Residues: 1-690 <ANAK>
A;Cross-references: GB:M57405; GB:M36075; NID:g204277; PIDN:AAA41206.1; PID:g204278
C;Superfamily: soluble guanylate cyclase; guanylate cyclase catalytic domain homology
C;Reywords: cGMP biosynthesis; heterodimer; phosphorus-oxygen lyase
F;432-660/Domain: guanylate cyclase catalytic domain homology <GCC>

A Smigrodzki R.M., Levitt P.;

The alpha 1 subunit of soluble guanylyl cyclase is expressed prenatally in the rat brain.";

I prenatally in the rat brain.";

I prenatally in the rat brain.";

C --- CATALYTIC ACTIVITY: GTP = 3',5'-cyclic GMP + diphosphate.

C --- ENZYME REGULATION: ACTIVATED BY NITRIC OXIDE IN THE PRESENCE OF LEXYME REGULATION: ACTIVATED BY NITRIC OXIDE IN THE PRESENCE OF MAGNESIUN OR MANGANESE IONS.

C --- SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAIN.

C --- SUBCELLULAR LOCATION: Cytoplasmic.

C --- SUBCELLULAR LOCATION: Cytoplasmic.

C --- SUBCELLAREOUS: THERE ARE TWO TYPES OF GUANYLATE CYCLASES: SOLEONS AND MEMBRANE-ASSOCIATED RECEPTOR FORMS.
                                                                                                                                                                                                                                               Query Match
